Dealer Information Database

TGM Abel & Berger International Ukraine offers an Internet based Dealer Information Database (D.I.D.) designed as an all-in-one tool for the Administration and Management of automotive Dealer Networks. The online solution enables executives and managers to get dealer information at a glance, to have the most up-to-date knowledge about what is going on in the dealer network and provides a most important basis of the automotive distributors work.

The Dealer Information Database (D.I.D.) is not a commonly used DMS and should not be confused as such. As a key data system for the management and development of the dealer network it retains all network information such as retail standards, financial information, marketing, after-sales and other departmental information all of which needs to be held in a central and well maintained database.

Because the system is created as a European / International system, multi- language is obligatory. In its different variants the system is used and highly recommended by the following importers:

- KIA Motors Europe
- Suzuki International Europe
- Daihatsu Germany, Austria and Belgium
- SsangYong Poland
- Landwind Europe
- Honda Motors Europe (North)

The basic Dealer Information Database (D.I.D.) modules include all dealer information, personnel records, measurement solutions for dealer standards and a complete reporting system. Dealers can also have online access. Additional available modules include, a customer relations management module with CSI program, new car ordering system and car configurator, parts stock management and ordering system, a field force steering module, a comprehensive customer vehicle database, a KPI module and a Training Management System (TMS) offering a clear choice of top training at once and all training administrative services.

The Dealer Information Database offers many benefits to the automotive importer and its dealer network, the most important being "cost saving". D.I.D. is also available as a multi-brand / multi-country or Multi-Product system allowing an organization to have several importer brands and distribution on one main information and reporting database.

Detailed brochures describing the DID and Training Management System (TMS) are available in Russian language on our website for download at the following links:

Dealer Information Database (DID):
